Overview

The **mvTBI-E4ES** is a powerful 4 channels incremental encoder / SSI / Two Pulse Encoder EtherCAT terminal.

For both Differential encoder and Two-Pulse encoder, **mvTBI-E4ES** provides differential inputs (RS422) with a 32 bit counter quadrature decoder with a maximum frequency of 10 MHz. Every counter step is taken over both rising and falling edge of the input signals.

It is possible to measure one or more of these parameters: Position, Frequency/Period, Time and Rate.

For frequency/period measuring, is possible to have an external or internal base timing.

For SSI encoder, **mvTBI-E4ES** terminal provide differential inputs (RS422) with maximum acquiring speed of 1Mbit/sec. Is it possible to get Position only or Position and Time.

Each of the channels of the **mvTBI-E4ES** is individually configurable via software in any of the supported modes.
